Introduction

We designed and implemented our database based on the ER diagram and schema drafts from previous lab sessions, which are also included in this report. Primary keys were assigned to core entities such as Carpark, Person, Vehicle, ParkingPass, and Rules, and foreign key constraints were used to link related tables and maintain data consistency. For example, each vehicle is associated with its owner through the Person table. Parking structures and lot distributions are linked to Carpark through MSCP and Includes. Parking activities are recorded through the Entry and Exit tables, which reference both vehicles and carparks. Similarly, SeasonParkingPass and ShortTermParking draw from ParkingPass, while ParkingOffense records violations by linking vehicles and their corresponding rule numbers. These relationships ensure that data remains accurate, traceable, and logically connected throughout the database.

The diagram illustrates the structure of a parking management system. Key components and relationships include:

- Person**: Attributes include NSIC, name, email, contactNo, No. of months, number of offences, total fine, VSN, date, and time. It has a **subscribes** association with **Parking Pass** and a **owns** association with **Vehicle**. It also has a **has** association with **50 registered vehicles**.
- Vehicle**: Attributes include VSN, Priority, Model, Year_Manufactured, Color, Vehicle_Type, and Brand. It is associated with **50 registered vehicles** and **50** (a constant).
- Parking Pass**: Attributes include subscription_charges, validityTo, amountPaid, VTB, purchaseTime, purchaseMonth, purchaseYear, and seasonPassType. It is associated with **Person** and **Short Term Parking**.
- Short Term Parking**: Attributes include hourly_charges and valid_for. It is associated with **Parking Pass** and **Carpark**.
- Entry** and **Exit**: Attributes include entry_date, entry_time, exit_date, exit_time, amount_paid, and vehicle_type. They are associated with **Carpark** and **CarparkOfType**.
- Rules**: Attributes include rule_no, vehicle_type, description, and fine_amount. It is associated with **Person** and **Carpark**.
- Carpark**: Attributes include PostalCode, blockNo, streetName, and section. It is associated with **Person**, **Rules**, and **CarparkOfType**.
- CarparkOfType**: Attributes include lot_count and lot_colour. It is associated with **Carpark**.

NOTE:

Why are all the tables in BCNF?

All tables in our design satisfy Boyce–Codd Normal Form (BCNF) because, for every functional dependency identified, the left-hand side (LHS) is a key (a minimal superkey). In other words, no non-key attribute determines another attribute. Even in cases where multiple candidate keys exist, we select one to serve as the primary key. Still, the important condition is that the determinant in each functional dependency is always a key. Since BCNF requires that every determinant must be a superkey, and our schema meets this requirement, all of our tables are confirmed to be in BCNF.

7. Clarifications

7.1. Not all HDB carparks have a free parking time range or free parking days (NULL values)

High-demand carparks often operate with 24/7 charging to prioritise residents who hold season parking passes, as these locations experience consistent usage throughout the day. In contrast, free parking periods are generally offered only at less-used carparks that have spare capacity. Typically, carparks are less crowded between 10:30 p.m. and 7:00 a.m., as well as on weekends and public holidays, when demand for parking decreases. For example, the SQL statement

```
INSERT INTO Carpark (carpark_ID, location, free_parking_range,
free_parking_days) VALUES ('CP025', 'Toa Payoh Lorong 1 Blk 101',
NULL, NULL);
```

indicates that carpark CP025 does not offer any free parking time range or days, likely because it is a high-demand carpark that must prioritize spaces for season parking holders.

7.2. Why some HDB addresses have NULL carpark_ID

Some HDB addresses may not have a dedicated carpark, as older blocks often share nearby public carparks. In such cases, residents can choose from several nearby parking options instead of having an assigned lot. For new BTO projects, carparks may still be under development and therefore not ready for use. Additionally, certain types of special housing, such as studio apartments or units for the elderly, may offer limited parking availability. As a result, addresses with a NULL value for `carpark_ID` in the database will generally have lower priority when matching carpark information. For example, in the following record —

```
INSERT INTO HDBAddress (unit_no, postal_code, street_name, block_no,
carpark_ID) VALUES ('10-101', '530101', 'Toa Payoh Lorong 1', '101',
NULL);
```

The `carpark_ID` field is NULL. This could indicate one of the reasons mentioned above, such as the carpark for that particular address still being under construction.
